(57) Summary: The invention relates to a filter cartridge (1) with a firmly fixed lid (10), which has a longer service life. The lid (10) is embodied in such a fashion that the bottom (11) of the lid extends towards the peripheral wall (3) of the cartridge container, to join the lateral wall (16) of the lid, by means of an edge section (14) curved inward, whereby the curved edge section (14) and the stripe-shaped lateral wall (16) join in the forming region to form an inwardly tapered common wall section (15). It is achieved therewith that the region fixing the lateral wall (16) to the peripheral wall (3) is subject only to tensile stress, thus leading to it that the risk of shear fracture is minimized and the internal pressure in the region of the common wall section (15) presses the wall section against the peripheral wall (3), and hence to exertion of an additional sealing force.
